

# **A Multi-Element Smart Gas Sensor with IEEE 1451 Protocol**

**Darold Wobschall**

**State University of New York at Buffalo**  
**Dept. of Electrical Engineering**  
**and**  
**Esensors, Inc.**  
*May version*

# Presentation Topics

- ◆ Goals and Applications
- ◆ Review of gas sensor technologies
- ◆ Analog signal conditioners – various technologies
- ◆ Smart (digital) sensor configurations
- ◆ IEEE 1451 protocol
- ◆ Multi-element gas sensor module design
- ◆ Networking considerations
- ◆ Test data

# Goals and Applications

- ◆ Measurement of gases for environmental monitoring, industrial safety and homeland security
- ◆ Design a sensor pad which allows interchange of sensors for various gases
- ◆ Convert gas sensor data to digital form (smart sensor)
- ◆ Interface to various networks
- ◆ Configure automatically (plug and play)
- ◆ Use commercial, off-the-shelf sensor elements

# Gas Sensor Technologies

- ◆ Semiconductor – resistive\*
- ◆ Semiconductor – voltage\*
- ◆ Amperometric\*
- ◆ Catalytic\*
- ◆ Infrared
- ◆ Photo-ionization
- ◆ Fluorescent
- ◆ Surface acoustic wave (SAW) & vibrating beam
- ◆ Capacitive\* and other

\* Used in this multi-sensor

# Solid State (Semiconductor, Resistive) Characteristics

- ◆ Based on Tin Oxide ( $\text{SnO}_2$ ) or similar metal oxide semiconductors
- ◆ Surface reaction with ambient gases when hot (350-500 °C)
- ◆ Heater (e.g. 4 v @ 100 mA) heats substrate
- ◆ Adsorbed gas reduces grain-boundary potential barrier and thus increases conductivity (decreases resistance)
- ◆ Delta-R is a function (approx. log or square root) of gas concentration (ppm)
- ◆ Resistance also decreases with temperature so temperature control needed for zero stability

# Solid state sensor construction

## CityTech Ltd – Semiconductor Sensor

# Solid State – Resistive Responses

# Solid Electrolyte Gas Sensor

- ◆ Similar to semiconductor gas sensor but has voltage output
- ◆ Heater (5v @ 11.5 ohms)
- ◆ Has thermistor for temperature control
- ◆  $V_{sen}$  increases 50 mv per factor of 10 change in gas conc  
(220 to 490 mv at 350 ppm)
- ◆ Requires hi-Z amplifier
- ◆ Examples: Figaro TGS4160 ( $CO_2$ )  
or Oxygen (zerconia)
- ◆ Periodic re-zeroing desirable

# Amperometric Characteristics

- ◆ Chemical reaction involving gas releases electrons at electrode (electrolysis reaction)
- ◆ Example:  $\frac{1}{2} \text{O}_2 + \text{H}_2\text{O} + 2\text{e}^- \rightarrow 2 \text{OH}^-$
- ◆ Gas is dissolved in electrolyte (e.g.  $\text{H}_2\text{O}$ )
- ◆ Reaction is reversible so number of electrons released is proportional to gas concentration (gas conc in electrolyte is proportional to partial pressure of gas in air)
- ◆ Reaction occurs at specific applied voltage (e.g. 0.55 volts)
- ◆ Sensor current output is proportional to gas conc (ppm)

# Amperometric Construction

City Tech Ltd – Toxic Gas Sensors

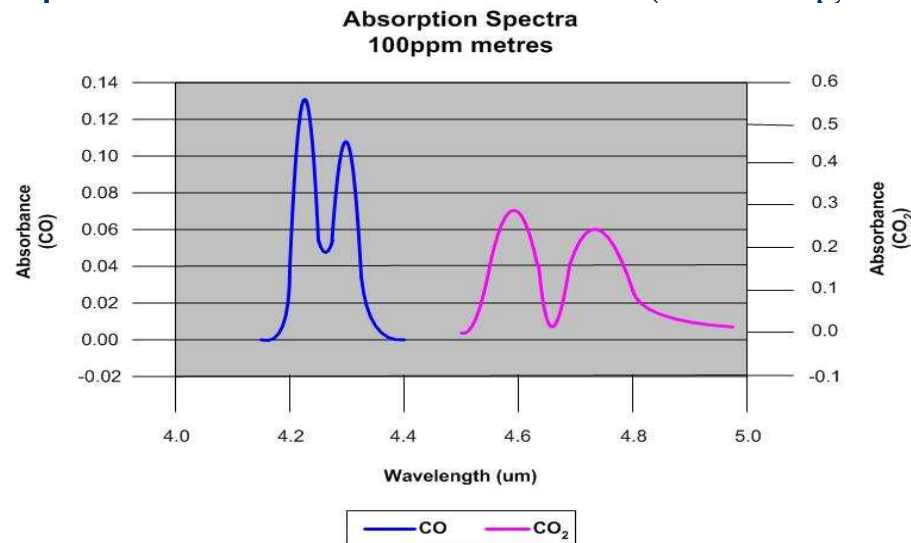

# Infra-red Principle

- ◆ Some gases absorb light at particular IR wavelengths
- ◆  $I/I_0 = e^{-Ax}$

where  $I/I_0$  is light absorbed during transmission,  
 $x$  is path length and  $A$  is absorption coef. at specific wavelength

- ◆ Transmission filters select specific wavelength bands
- ◆  $A$  is proportional to gas concentration
- ◆ IR sensors reproducible but not sensitive (need high conc or long paths)

# Infra-red Construction

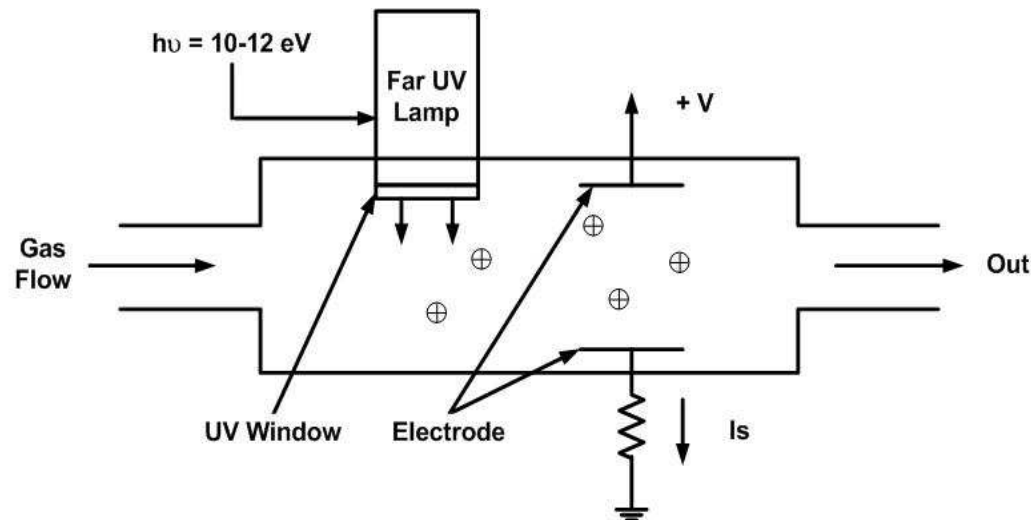

## Gilway Visible/IR Lamps for NDIR Gas Sensors

Acoustical detection an attractive option

# Photo-ionization

- ◆ High energy UV photons ( $> 3\text{ eV}$  or  $< 300\text{ nm}$ ) will ionize some gases (e. g. toluene, trichloroethylene) but not others (e.g. air, methane)
- ◆ Ions collected by e-field produce a current proportional to gas conc
- ◆ Sensitive ( $< 1\text{ ppm}$ ) but not selective
- ◆ Special UV lamps costly and have limited life (also high power)

# Fluorescent

- ◆ UV light impinges on some organics produces a fluorescent light proportional to ambient gas concentration (e.g. oxygen)
- ◆ High sensitivity (because photo-detectors are sensitive)
- ◆ Applicable only to a few gases (but used with many biological materials where it can be sensitive and selective)
- ◆ Few commercial sensors using this technology are available.

# SAW and vibrating beam

- ◆ Surface acoustic wave (SAW) travel from transmitter to receiver on substrate surface
- ◆ Velocity depends on surface mass which is effected by adsorbed gases
- ◆ Positive feedback produces oscillation at frequency which depends on sound velocity and thus gas concentration

# SAW and vibrating beam continued

- ◆ Usually used in pairs (one not exposed to gas) and difference (beat frequency) measured
- ◆ Moderate sensitivity and selectivity
- ◆ Vibrating beam type (usually quartz) resonance frequency varies with mass loading and thus gas concentration.
- ◆ Can be small and low cost
- ◆ Few commercial products available.

# Capacitive

- ◆ Dielectric constant of polymer increase with absorbed gas such as water vapor (K is 80 for water, 2-3 for polymer)
- ◆ Typically C increase by 10-30% as relative humidity (RH) varies from 0 to 100%.

# Other Gas Sensor Technologies

**These techniques have few commercial product available**

- ♦ Polymer resistance
- ♦ Fiber optic
- ♦ ChemFET
- ♦ Miniaturized versions of mass spectrometers

# MEMS Sensors

- ◆ Micro Electronic Mechanical Systems (MEMS) type sensors are miniaturized versions of types already described
- ◆ Promise much smaller size, lower power and lower cost than conventional gas sensors
- ◆ Many under development but few commercially available.

# Linearization by shunt resistors

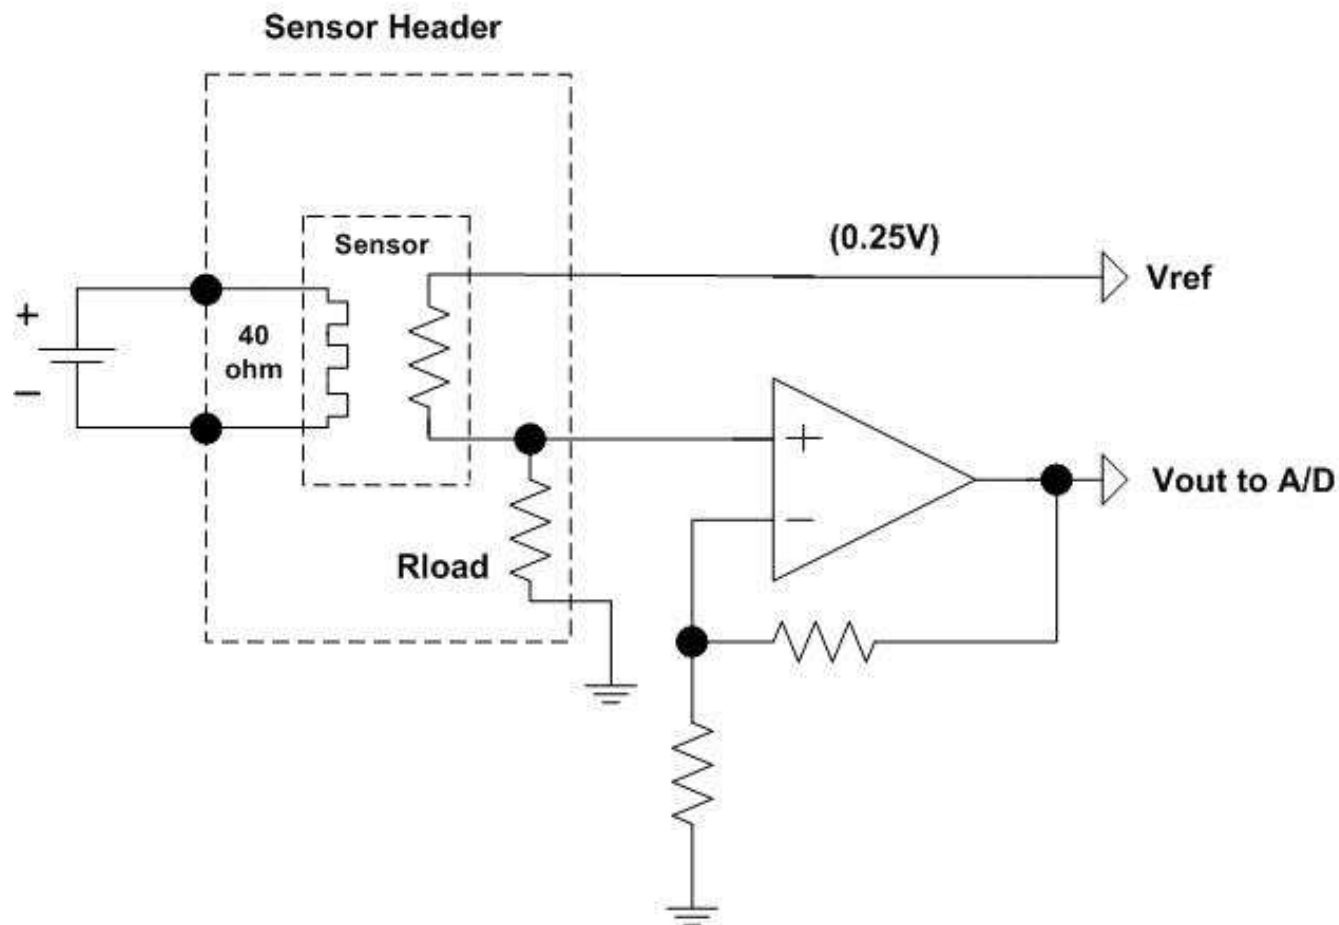

$R_s$  has log response vs  $T$   
(thermistor)

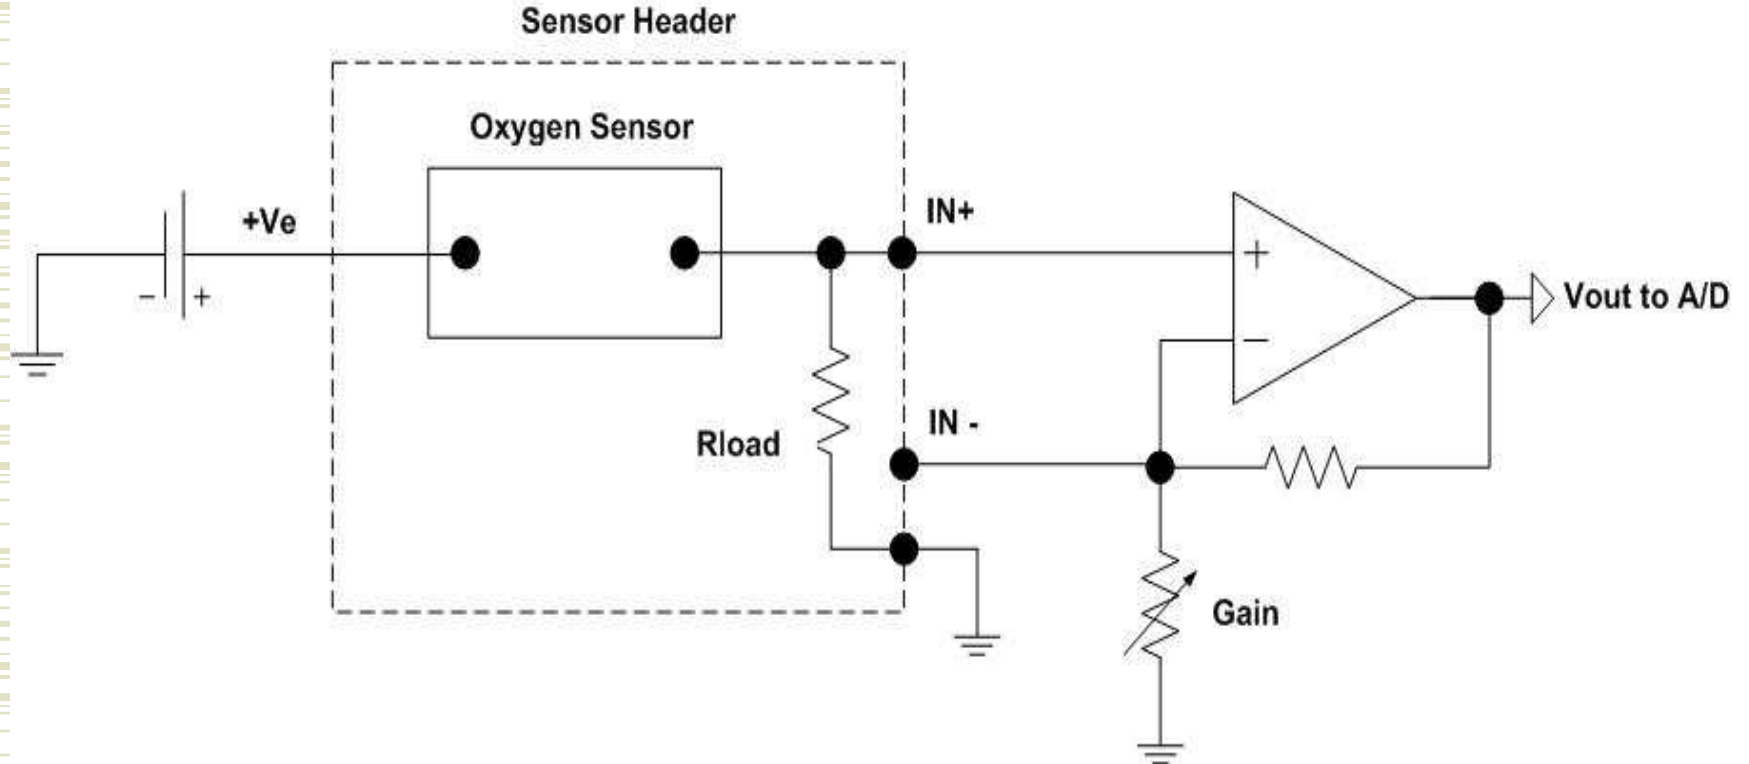

# Linearization by load resistors

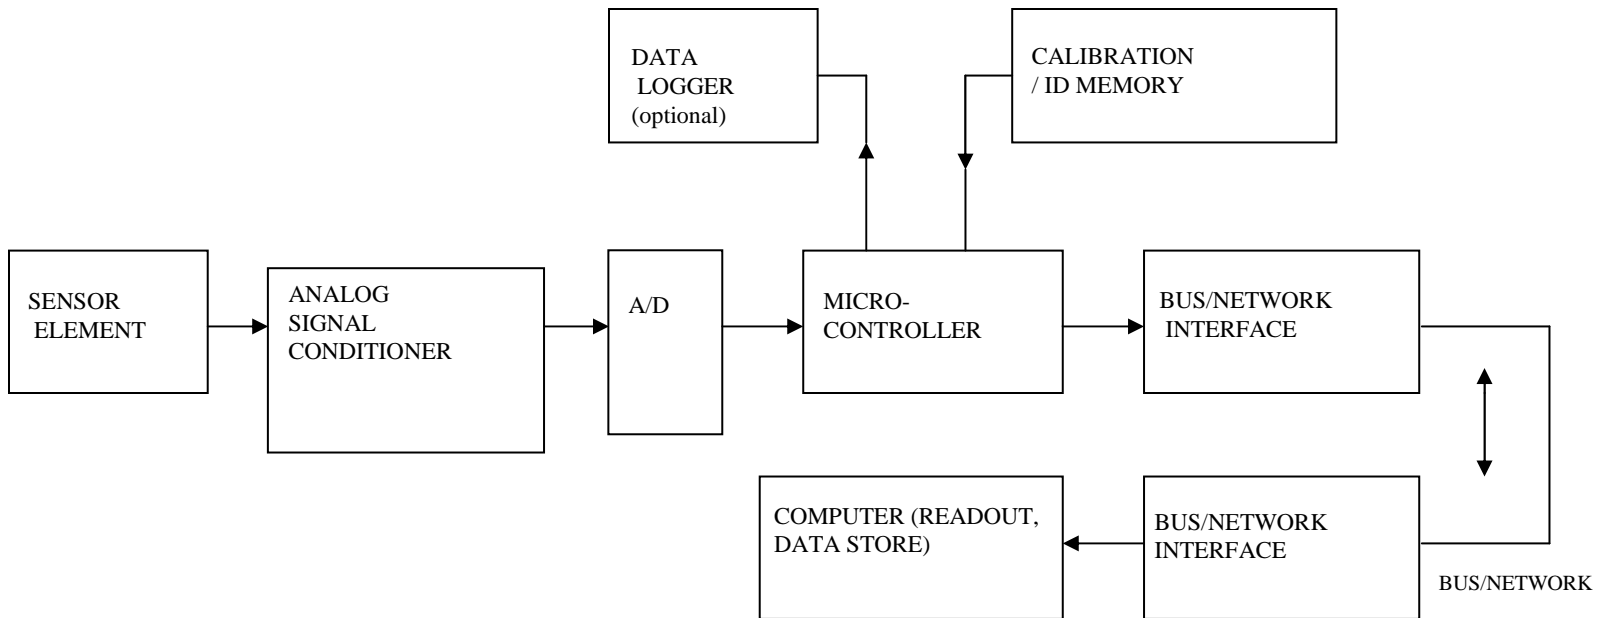

# Signal Conditioner for Voltage Type Sensors

# Signal Conditioner for Amperometric Type Sensors

# Generic Smart Sensor Block Diagram

# Need for Network Standards

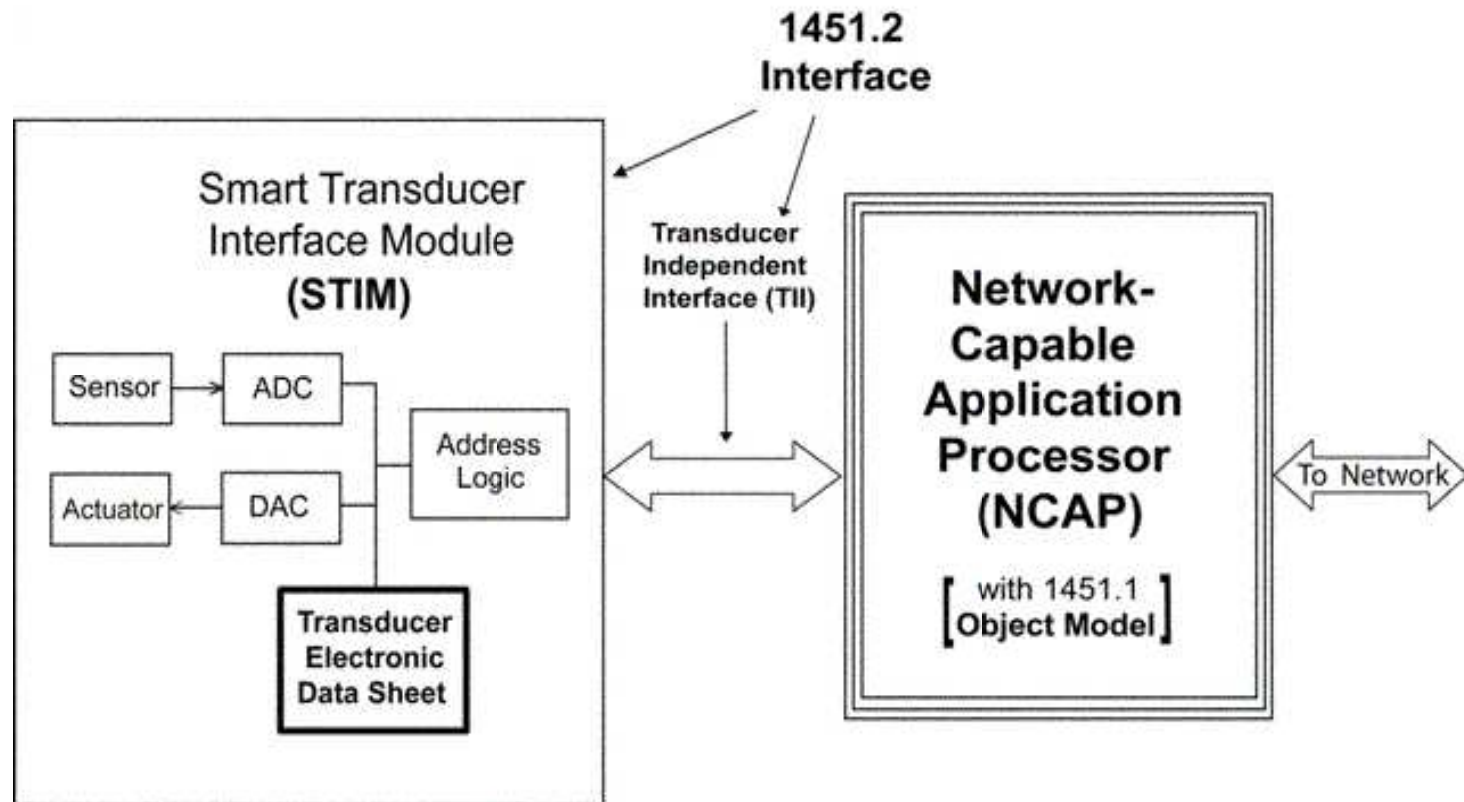

- ◆ Smart sensors require a digital network
- ◆ Over 50 sensor networks and busses in common use
- ◆ Users and manufactures would like one standard to reduce manufacturing/installation costs and for plug&play capability
- ◆ No single local network is likely to dominate in near future due to divergent needs
- ◆ The Internet via Ethernet will likely be one of the dominate networks (but cost and complexity are problems)
- ◆ The IEEE 1451 standard for sensor interfacing overcomes many of the complications of multiple networks

# IEEE 1451 Parts

- ◆ IEEE 1451.0 Protocols/formats (approval process underway)
- ◆ IEEE 1451.1 Object model (approved 1999)
- ◆ IEEE 1451.2 Interface (approved 1997)\*
- ◆ IEEE 1451.3 Local network (approved 2003)
- ◆ IEEE 1451.4 Analog & TEDS (just approved)
- ◆ IEEE 1451.5 Wireless (early approval process)
- ◆ IEEE 1451.6 Canbus (just started)

\* Enhancement /revision working group in process

## --Transducer Electronic Data Sheet --

### Machine Readable

- ◆ Meta-TEDS (mandatory)
- ◆ Channel TEDS (mandatory)
- ◆ Calibration
- ◆ Physical Layer Meta (proposed)
- ◆ Physical Layer Channel (proposed)

Note: One TEDS per channel for Channel and Calibration

### Human Readable

- ◆ Meta-ID TEDS
- ◆ Channel-ID TEDS
- ◆ Calibration-ID TEDS
- ◆ Application Specific  
End Users' Application-Specific TEDS
- ◆ Future Extensions  
Industry Extension TEDS

*New Tuples format TEDS approved by Dot 2 working group*

Dot2

# Advantages of the IEEE 1451 Standard

- ◆ Continuing network interface and microcontroller cost reductions have made interface more attractive.
- ◆ The sensor industry is closer to recognizing the necessity for a sensor network standard.
- ◆ The general concept of the IEEE 1451 approach, especially TEDS, is supported by many.
- ◆ Working groups are addressing the dot2 problems and expanding the standard via dot3, dot4, and dot5.

# TEDS Memory Types

- ◆ Option #1 – Standard dot2 TEDS

- \* Meta-TEDS (binary/machine readable)

- [Meta is all channel]

- \* Meta-ID-TEDS (ASCII)

- \* Channel-TEDS (binary)

- Option #2 – Modified dot4

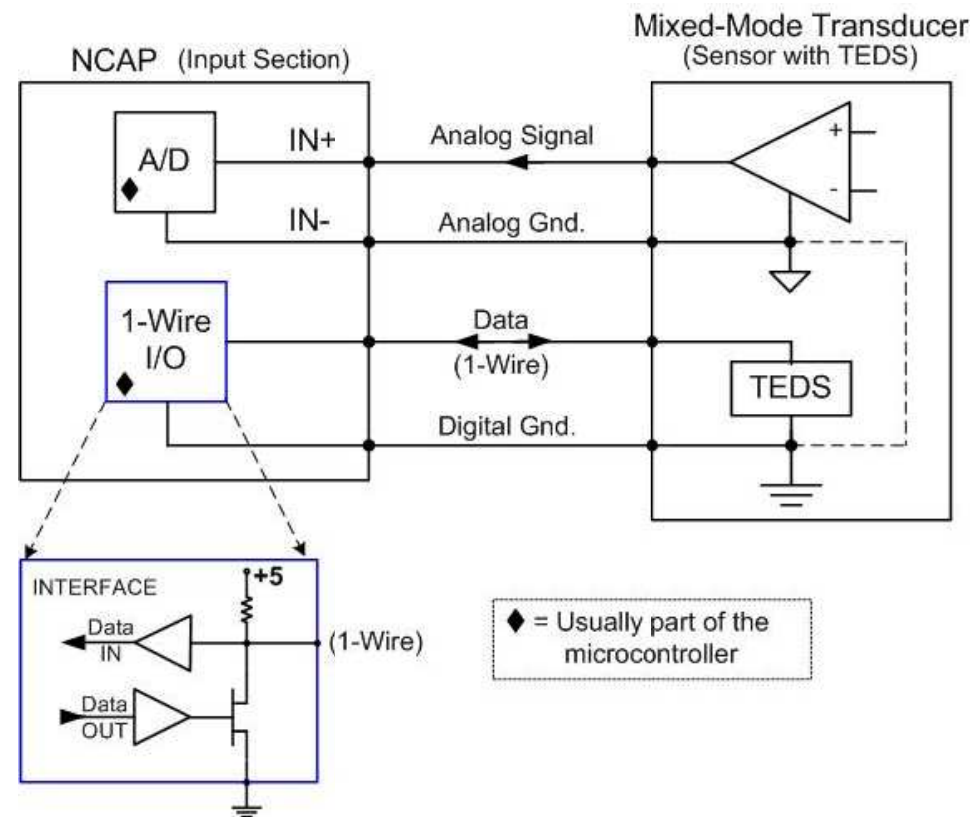

- \* Basic TEDS (8 bytes, binary)

- \* ID TEDS (user provided 24 bytes ASCII)

- \* Standard templates available but special used here

Dot2

# IEEE 1451.4 (Dot4) Interface

# Basic TEDS

Serial Number 102

Back to Main

## Basic TEDS (8 bytes)

- ◆ Manufacturer ID (14 bits)
- ◆ Model Number (15 bits)
- ◆ Version Letter (5 bits, A-Z)
- ◆ Version Number (6 bits)
- ◆ Serial Number (24 bits)

Dot4

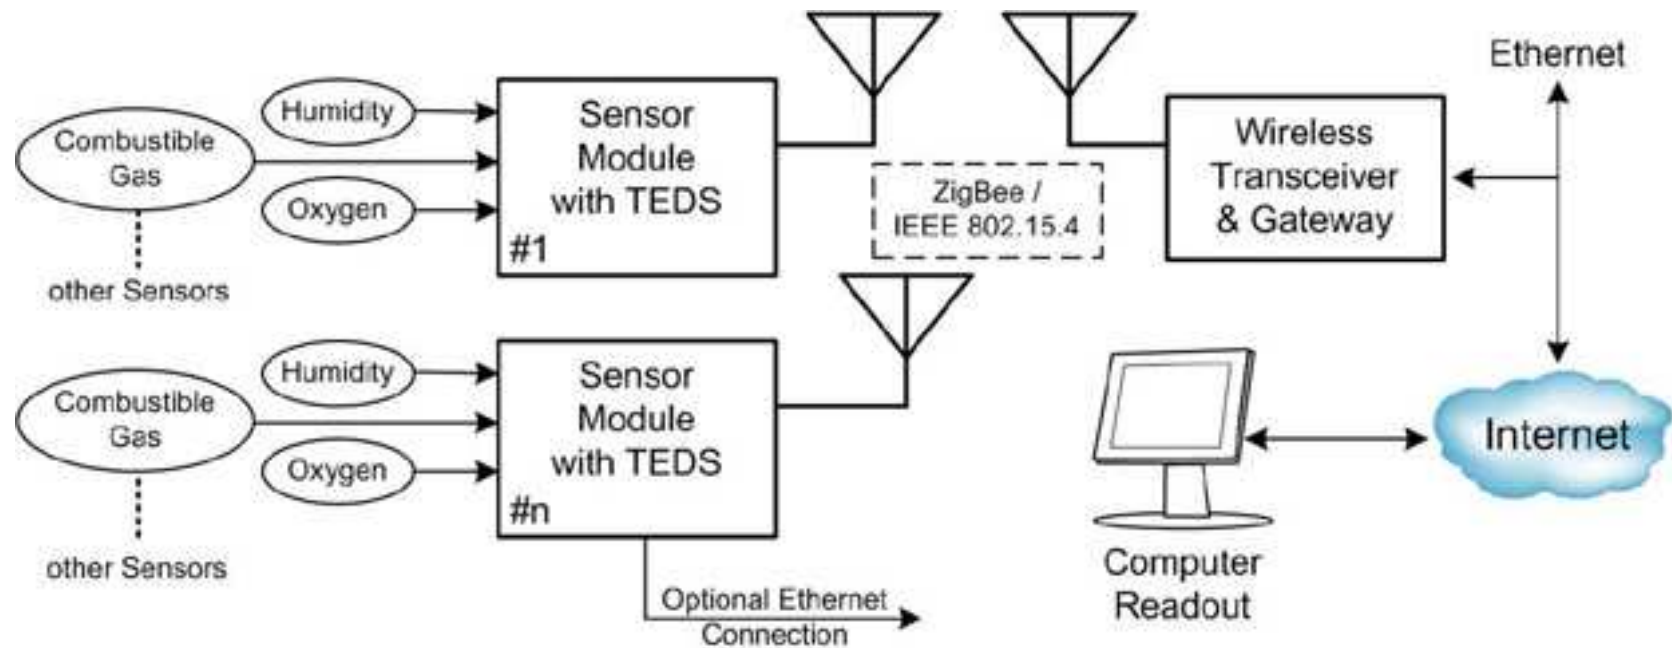

# Dot 2 to Dot 4 TEDS Conversion

- ◆ Dot4 TEDS read over 1-wire (specific sensor head)
- ◆ Contains standard TEDS and special (manufacturer specific) TEDS
- ◆ Special head configuration data used for signal conditioner setup
- ◆ A/D data read in and converted to floating point (Dot2 option)
- ◆ Calibration data from Dot4 TEDS used to convert to engineering units
- ◆ Data from Dot4 standard TEDS used to prepare tuples style Dot2 (Dot0) TEDS (Meta, Channel, Meta-ID, and Channel ID)
- ◆ Parameters (fields) not in Dot4 TEDS inserted into Dot2 TEDS
- ◆ UUID or Universal Unique Identification (10 bytes) consists of 6-byte Dot4 TEDS as the least significant + 4 bytes (FFFF0000h), which will not occur using the specified Dot2 formula

# Multi-Element Gas Sensor Design Challenges

- ◆ Sensor elements for different gasses use different technologies, and thus signal conditioners, making sensor head/element interchange difficult.
- ◆ Many reliable off-the-shelf sensor elements require large amounts of power (heaters) thus reducing battery life.
- ◆ Multiple communications channels (Wireless, Internet via Ethernet) may be needed
- ◆ Auto configuration (plug and play)
- ◆ Should be easy to use
- ◆ Moderate cost desirable

## \* Technologies Accommodated

**Semiconductor with Heater (e.g. CO) – 3 Types**

**Amperometric (e.g. O<sub>2</sub>) – 2 Types**

**Catalytic (e.g. Methane) – 2 Types**

# Gas Sensor List

## *HVAC/Environmental*

- ♦ Carbon dioxide
- ♦ Humidity /Temperature
- ♦ Smoke

## *Decontamination/Industrial gases*

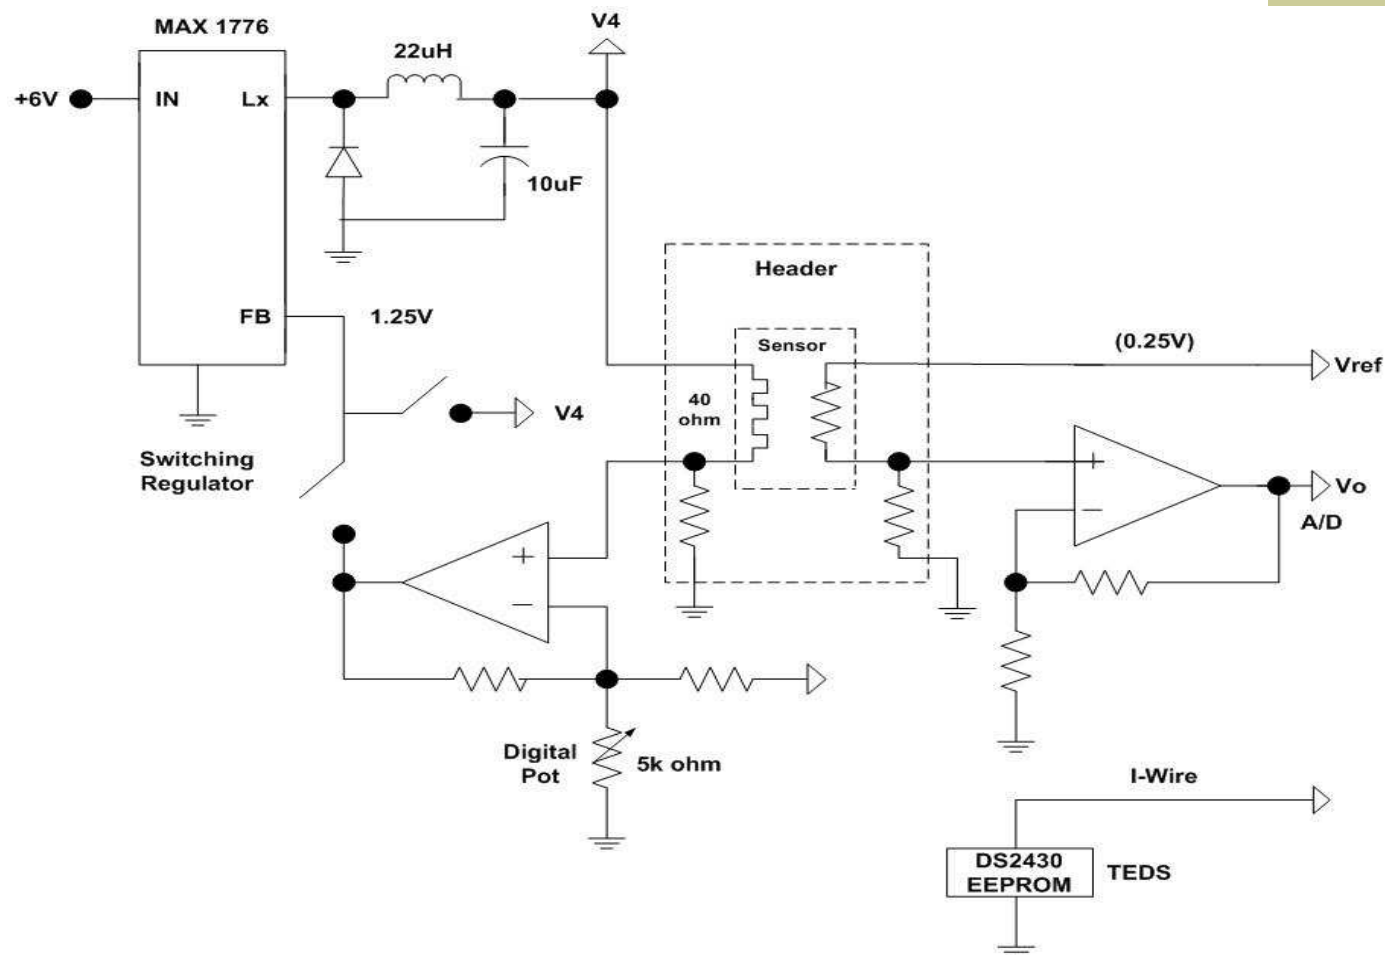

- ♦ VOC/Methyl bromide
- ♦ Ozone
- ♦ Hydrogen peroxide
- ♦ Oxygen
- ♦ Combustible gases
- ♦ Carbon monoxide

## *Toxic gas sensors*

- ♦ Hydrogen sulfide
- ♦ Sulfur dioxide
- ♦ Chlorine (chlorine dioxide)
- ♦ Hydrogen cyanide
- ♦ Nitric oxide
- ♦ Nitrogen dioxide
- ♦ Hydrogen chloride

## SHT1x / SHT7x Humidity & Temperature Sensor

Block Diagram

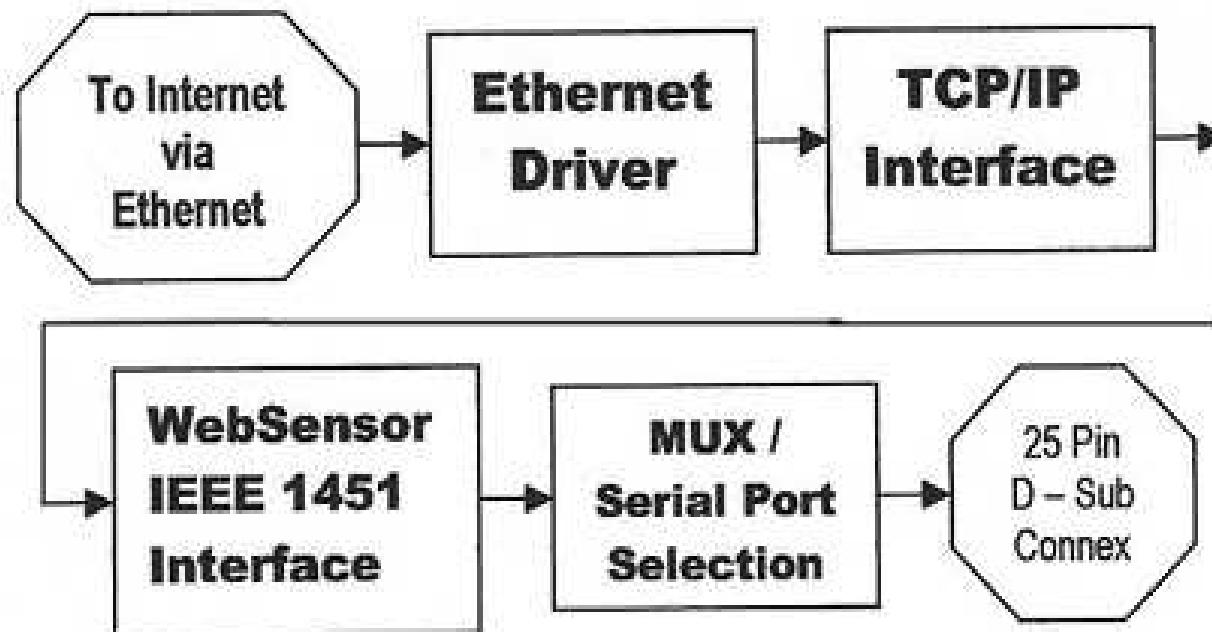

Parameter	Conditions	Min.	Typ.	Max.	Units
<b>Humidity</b>					
Resolution <sup>(2)</sup>		0.5	0.03	0.03	%RH
		8	12	12	bit
Repeatability			±0.1		%RH
Nonlinearity	raw data		±3		%RH
	linearized		<<1		%RH
Range		0		100	%RH
Response time	1/e (63%) slowly moving air		4		s
Hysteresis			±1		%RH
Long term stability	typical		< 1		%RH/yr
<b>Temperature</b>					
Resolution <sup>(2)</sup>		0.04	0.01	0.01	°C
		0.07	0.02	0.02	°F
		12	14	14	bit
Repeatability			±0.1		°C
			±0.2		°F
Range		-40		123.8	°C
		-40		254.9	°F
Response Time	1/e (63%)	5		30	s

# Communication Options

- ◆ Internet via Ethernet  
TCP/IP protocol similar to websensor
- ◆ RF Point-to-point – initial wireless version  
900 MHz spread spectrum (Chipcom)
- ◆ Full-feature wireless network (IEEE 802.15.4/Zigbee)  
Scheduled transmissions for power reduction, node-to-node hopping, collision recovery, error handling

# NCAP Block Diagram

# Test data

- ◆ VOC response to ethanol measured (100 to 3000 ppm)
- ◆ Method: small volume solvent injections into closed container
- ◆ Solid state VOC sensor resistance change converted to ppm and transmitted digitally
- ◆ Data from computer plotted

# Summary

- ◆ Interchangeable gas sensor elements/heads of varied technology requires adaptable signal conditioners
- ◆ A microcomputer-based smart sensor with the required signal conditioners was developed for this purpose.
- ◆ Transmission of sensor data over a network was demonstrated
- ◆ IEEE p1451 protocol was used for simplified signal readout and plug and play capability.
